

App Summary

Repo: sharna

What it is

A personal portfolio website built as a React single-page app. It presents Sharna's profile, projects, resume access, and contact options with animated visuals.

Who it's for

Primary persona: recruiters, hiring managers, collaborators, and clients evaluating Sharna's software engineering background and project work.

What it does

- Shows a landing section with branded logo, intro text, and scroll cue.
- Provides an About section with background details and preferred technologies.
- Lists portfolio projects as clickable cards linking to external work.
- Offers GitHub, LinkedIn, CodePen, and Stack Overflow profile links.
- Links directly to a hosted resume PDF from the navigation menu.
- Includes a contact form with animated send states and email copy-to-clipboard.
- Uses responsive navigation and fixed contact info for larger screens.

How it works

- Components: React 16 mounts App from index.js and renders Navbar, StarrySky, Home, About, Portfolio, Contact, Footer, and desktop-only FixedInfo.
- State: Redux creates a store with one loaded reducer for logo/model flags, while the active UI mostly relies on local component state.
- Effects and services: anime.js and GSAP animate the menu, form, and fade behavior; public/index.html initializes EmailJS, but Form.js comments out the actual send call.
- Data flow: static project/profile content lives in components and local assets; no active backend, database, auth, or API request flow was found in repo. A Three.js astronaut model exists but its About-section render path is commented out.

How to run

- Install dependencies: `npm install`
- Start locally: `npm start`
- Build for production: `npm run build`
- Deploy clue from repo: `netlify.toml` runs `npm run build`

Not found in repo: backend service code, API server, database, authentication, or tested deployment instructions beyond package scripts and Netlify build command.
